

COURSE SYLLABUS

AI Mastery

From Slop to Shipped

Public-facing syllabus, modules, deliverables, and pricing.
v1.0 — Companion to the Practice Manual.

What you walk away with

This is a self-paced course (with an optional 4-week live cohort tier) for operators and founders who already use AI but cannot get it to produce work that sounds like them — and who want to ship a real software product without hiring an engineering team.

By the time you finish

- You publish content that sounds like you wrote it, at roughly 5x the pace you do today.
- You have a deployed personal site, a full-stack dashboard, and at least one shippable SaaS-shaped project.
- You have a reusable system — folder structure, business context, prompt library — that compounds rather than degrades over time.
- You understand enough about web apps to read code your AI agent writes and reject the bad parts.
- You have a 21-day launch playbook, a pricing scaffold, and email + landing-page copy patterns you can reuse on every future product.

WHY THIS MATTERS

Most AI courses teach prompts. This one teaches the system around the prompts so quality compounds. The prompt is the smallest part of the system.

Who this is for (and isn't)

A great fit if you...	Probably not for you if...
Already use AI weekly and the output sounds generic.	You want a 'magic prompt' that does the thinking for you.
Want to publish on-voice content at 5x the speed.	You're looking for a no-code app builder.
Want to ship a SaaS without hiring engineers.	You enjoy hand-typing every line of code.
Are willing to spend an afternoon on the foundation.	You can't commit 20 minutes a day for 30 days.
Have a defined niche or business you want to build around.	You want general-purpose 'productivity hacks.'

Curriculum overview

Twenty modules across five parts. Total study time depends on tier and how many of the projects you actually build, but the typical pacing is below.

Part	Modules	Self-paced hours	Outcome
Foundation	5	~3 hrs	Folder structure, business context, prompt anatomy.
Content workflows	5	~5 hrs	Tweets, long-form, short-form, repurposing engine.
Vibe coding fundamentals	4	~6 hrs	Setup, mental models, deployed portfolio site.
Building real SaaS	3	~12 hrs	Full-stack dashboard, lead-gen SaaS, thumbnail SaaS.
Production readiness	3	~3 hrs	Security audit, deployment, pricing & launch.

Module-by-module syllabus

Part 1 — Foundation

M1. The slop problem

- Why AI output sounds generic — and why it isn't the model's fault.
- Live demo: same prompt, three runs, three different results.
- Exercise: prove the principle to yourself in 15 minutes.

M2. The 4-folder system

- The structure that holds business context, data, and prompts.
- Why this exact shape (single source of truth, voice fidelity, prompt portability).
- Walkthrough: set it up in 5 minutes.

M3. Your business context

- The 12-question framework (the most important file in the system).
- Concrete answer set, walked through line by line.
- Exercise: 90 minutes to write yours; attach it to every prompt thereafter.

M4. Your data, your voice training fuel

- How much data is enough (per output type).
- Naming conventions that turn the model into a soft preference engine.
- Tactical: how to pull YouTube transcripts and bulk-export tweets in 10 minutes.

M5. The anatomy of a prompt

- The six prompt levers (length, role, process, examples, constraints, format).
- The prompt-length law and its corollary.
- Walkthrough: 1-line prompt vs 1-page prompt, side by side.

Part 2 — Content workflows

M6. The tweet generation loop

- End-to-end: idea → 4 drafts → voice audit → human edit → schedule → measure.
- Exercise: produce a 7-day batch in 90 minutes.
- How to feed winners back into your dataset so the system gets smarter.

M7. Long-form: YouTube and blog

- Style extraction phase: building a House Style Guide from 3–5 transcripts.

- Generation phase: full script with B-roll cues + shoot notes.
- Exercise: produce one ready-to-record script.

M8. Short-form: Reels, Shorts, TikTok

- 3-second hook patterns and 7-second pattern interrupts.
- Exercise: batch-produce 9 shorts; film 3 in one sitting.

M9. The repurposing engine

- One idea → six outputs (long-form + 3 shorts + tweets + newsletter + sales asset).
- Exercise: the 1-to-6 challenge applied to your next long-form.

M10. Building your content rhythm

- How to convert the loops into a sustainable weekly cadence.
- Tagging winners, pruning losers, measuring what matters.

Part 3 — Vibe coding fundamentals

M11. Setup: Claude Code or Antigravity

- Stack choice, install, authentication, sanity-check prompt.
- Pasting in the house rules so the agent inherits your standards on day one.

M12. How web apps actually work

- The five-layer model (frontend, API, database, auth, infra) explained for non-coders.
- Every feature is a CRUD verb — sketching features as four-line specs.

M13. The vibe-coding development loop

- Plan → restate → approve → diff review → manual test → commit.
- Why the agent is a junior pair, not a senior architect.

M14. Project 1 — Portfolio site (live in 30 min)

- Acceptance test: Lighthouse 95+, dark-mode toggle, custom domain.
- Walkthrough from clone to deploy.

Part 4 — Building real SaaS

M15. Project 2 — Client dashboard (full-stack)

- Auth, two roles, Postgres + Row-Level Security, real-time updates.
- Definition of done includes RLS bypass tests, not just visual tests.

M16. Project 3 — Lead-gen SaaS

- Third-party APIs, async jobs, Stripe metered billing.
- Pricing scaffold + cost-cap patterns to keep the business viable.

M17. Project 4 — Thumbnail generator SaaS

- Vision LLM + image API + Supabase Storage.
- Validation lap: emailing 5 creators before you write a line of code.

Part 5 — Production readiness

M18. The 80/20 of security for vibe coders

- The 10-question pre-launch audit.
- Defense in depth, not perimeter.

M19. Deployment, monitoring, iteration

- The pipeline from git push to live URL.
- Monitoring on day one (Sentry, uptime, cost alerts, backups).

M20. Pricing, marketing, launch

- Pricing in three layers (anchor, plans, mechanic).
- The 21-day launch playbook with daily moves.

Pricing & what's included

Three tiers

	Starter	Pro	Cohort
Price (one-time)	\$79	\$249	\$999
56-page Practice Manual	✓	✓	✓
Practice Kit folder	✓	✓	✓
6 production-grade prompts	✓	✓	✓
Lifetime updates	✓	✓	✓
3 starter code repos	—	✓	✓
8 video walkthroughs	—	✓	✓
Private community Discord	—	✓	✓
Priority email support	—	✓	✓
4-week live cohort	—	—	✓
Weekly group office hours	—	—	✓
1 hot-seat code/launch review	—	—	✓
Completion certificate	—	—	✓

Refund policy

- Starter & Pro: 14-day, no-questions-asked refund.
- Cohort: full refund before kickoff; prorated thereafter.

Bonuses (for early waves)

- **Pre-launch list bonus:** \$25 off code STARTER25 for the first 7 days post-opt-in.
- **Cohort priority:** First 25 applicants from the email list skip the application queue.

KEY IDEA

All tiers are one-time payments with lifetime access. No recurring subscription. Updates to the Practice Manual ship to all tiers free for life.

Frequently asked questions

Do I need to know how to code?

No. The vibe-coding chapters assume zero programming background. They teach the mental models (web apps in five layers, CRUD as a thinking tool) and walk you through prompting an AI to write the code while you review and ship.

Which AI do I need? Claude? ChatGPT? Gemini?

Any modern frontier model works for the content side. For coding we recommend Claude Code or Antigravity (Google's IDE that bundles Gemini). The framework is portable — switch tools without rewriting your prompts.

How long until I see results?

The 15-minute experiment in Module 1 proves the principle the same day. Most students publish their first on-voice tweets in week 1 and ship the portfolio project in week 2. Lead-gen SaaS-shape projects typically take 3–4 weekends.

What if I already have an audience and content?

You're in the best position. You already have data — the most expensive part of the system. The course shows you how to feed it to the model so the model writes in your established voice instead of overriding it.

Is this just prompt engineering?

No. Most courses teach prompts. This one teaches the system around the prompts: business context, organized data, reusable prompt templates, and (in Pro) starter code repos. The prompt is the smallest part.

Will the manual go stale as AI tools change?

The principles (4-folder system, business context, data, prompts, security 80/20) are stack-independent. Specific tool screenshots get refreshed in updates — included free for life.

How is the cohort run?

Quarterly, capped at 25 students. Four weeks. One 90-minute group office hour per week (recorded). Each student gets one 30-minute hot-seat review of either their content workflow or their code repo. Active community channel for the duration with continued read-only access after.
